

Abstract

A method of producing a sample (10) of a treatment outcome on a textile specimen is described. A textile specimen in the form of a web section (1) along its full production width (B) is provided with a leader (6) on one end (2) located in the longitudinal direction of the web section (1), and at the other end (3) it is provided with a trailer (7), and then it is passed through a production installation for treatment in the direction of feed (8).
